Backup- Disaster Recovery and Backup Services

Optional Feature Packages

Identification of Essential Data

Our technology consultants work with the client to identify and categorize critical data. This information can be used as a starting point in planning and designing a backup strategy.

Data Assessment and Analysis

Our technology consultants work with the client to assess the current use, manipulation and storage of various client data to determine if any changes to the process are required. This analysis also leads directly into a disaster recovery plan creation and design.

Business Continuity Planning

We identify, understand and prioritize the criticality of business processes to reduce risks during a business interruption. Using that information, we implement a plan to keep client business services available during emergencies or while other supporting services are interrupted. To further support that goal, we develop and implement rapid restore procedures.

Disaster Recovery

We design, document and test a custom disaster recovery plan for each client. Critical data and devices are identified and incorporated into the plan to ensure a rapid recovery from a data loss or service interruption.
